

INTERNAL FRICTION ELECTROLYTIC DEPOSITS OF CHROME.

N.I. Glyantsev, Y.A. Stekolnikov, V.I. Kovalevsky, V.V. Kotov

It is shown, that the maximum of internal friction electrolytic deposits of chrome is caused by presence in them of various quantity of hydrogen. Use of organic additives in electrolit of chromium plating, and also low-temperature tempering promote reduction decreasing of hydrogen deposits of chrome, and high-temperature tempering deletes hydrogen completely.
