

TO A QUESTION ON TECHNOLOGICAL QUALITY OF SPARKLING TABLETS

A. M. Shevchenko

Studying physical and chemical and processing behavior of granulates for sparkling tablets has allowed generalizing the most significant indexes of their quality, and also their agency on quality of a finished product. With the help of correlation analysis dependence of factor of gas-making, a repressing pressure of tablets from matrixes and a time of dissolution are established. The found optimal values of the generalized criterion of technological quality allow defining, in what limits there should be values of private parameters.
