

RESEARCH OF COMPARATIVE ANTIULCEROGENIC ACTIVITY OF MINERAL WATER “ESSENTUKI №17” AND ITS SYNTHETIC ANALOGUES

A. M. Shevchenko, V. F. Reps

It was investigated antiulcerogenic and hepatoprotective activity of the sparkling granules containing a synthetic saline complex of mineral water “Essentuki №17” compared with natural mineral water and the "not sparkling" powder containing the basic ions of mineral water. It fixed, that natural mineral water in the biological plan was more effective than a powder, but was practically identical to sparkling granules.
