

THE ANALYSIS OF THE PHARMACEUTICAL MARKET OF THE PREPARATIONS APPLIED TREATMENT ARTERIAL HYPERTENSIA

T. G. Afanasieva

Arterial hypertension (AH) one of the most widespread diseases of cardiovascular system. Population frequency of AH among adult population of the majority of the countries makes about 5-20 %, and its prevalence at persons of elderly and senile age exceeds 50 %. Though itself AH does not cause essential deterioration of a life and working capacity, it is a major factor of risk of development of some serious cardiovascular complications (first of all a heart attack and an insult), the subsequent physical inability, and its share in structure of the general death rate from cardiovascular diseases reaches 20-50 % [1, 2].
