

ECOLOGO-ECONOMIC MECHANISM OF IMPROVING OF EFFECTIVENESS AGRICULTURAL LAND RESOURCES FUNCTION

G.I. Chogut

The article is devoted to the problem of rational use of land. A scientific model and basic principle of improving agricultural systems were offered for ecological sustainability. The nature of main features of territory (relief, hydrological parameters, soil fertility) determines peculiarities of economic development. This principle is most effective both ecologically and economically. Introducing adaptive landscape systems of agriculture under conditions of Voronezh oblast enables to prevent the development of water erosion.
