

ADAPTIVE-RATIONAL FORECASTING IN ECONOMIC SYSTEMS: CONCEPTUAL IDEAS AND MODELS OF REALIZATION

V. I. Tinyakova

Key ideas of the adaptive-rational approach to forecasting economic processes and possible variants of their formalization are discussed. The considered variants are focused on specificity of solved problems and represent models, in which forecasting trajectories find reflections of a trend of the past and subjective expectations of the future. Anticipatory calculations on such models allow receiving the most plausible image of the future.
