

ECSOLITES IN STRUCTURES OF NAKYNSKY FIELD (WEST JAKUTIA)

Nikulin I.I.

Review the sedimentary rocks that belong to the main tectonic epochs of formations of interriver field. Geologic formations (mega complexes) are distinguished that answer to four tectonomagmatic stages of the formation of the lithosphere of the Siberian Platform: baikalic (PR21-3), kaledonic (PR24-S), earlygercinic (D-C1), alpic (J-Q). The relationship of the structures formation with the sedimentary accumulation is shortly described. The mineralogy of clay and clay minerals of basic Mesozoic levels (late jurassic) is given.
