

**THE SITUATIONS OF SEDIMENTATION
ON THE TERRITORY VORONEZH ANTECLISE
DURING MIDDLE DEVONIAN**

S.V. Manukovskiy, A.I. Mizin

The situations of sedimentation on the territory Voronezh anteklise during middle Devonian is considered. It is installed that from south to north continental conditions were replaced on connecting, coast-sea and shallow-sea. The continental sediment because of the following eroded in morso light only. At the beginning initially epoches were washed away weakly of the sort and demolition with continent was flat, then demolition increased that was reflected in change carbonates Roks on terrigenes Roks.
