

DETERMINATION OF TRANSISTOR STRUCTURE MODELS PARAMETERS FROM EXPERIMENTAL DATA

Bobreshov A. M., Averina L. I., Uskov G. K., Korovchenko I. S.

The method of determination of solid-state models parameters from experimental data was suggested. Experimental data can be different characteristics, such as VAC, linear parameters for DC-modes, blocking and intermodulation characteristic etc. Advantages of this method are: independent of method from models equivalent schemes, opportunity of using different experimental data for parameters determination, simple realization in CADs.
